Project

The project is about making a windows form application on VS to edit data from a database, and make another program using ASP.NET to view data.

Windows Form application is build for INSERT,UPDAT,DELETE data from a database and the ASP.NET application is for view data from the database.

ASP.NET is a Web form application (I made it using MVC)

I add a grid view to both applications.

SQL

I have a database running and it has Mix access it will make it possible to gain access using a username and password or windows authentication.

But windows authentication has the full access to the database. I made a user through windows authentication and gave read and write access to that user, and used that user on my windows form application.

Data in the database

There are 3 tables in total.

[Data in the database](#) – this hyperlink will show a picture of the data in the database (the country table and ranks table is combined with an inner join there for it will represent in a one table)

Country table, Ranks table and 3 user data tables. This will explain in the IR diagram I made about the database.

[The IR diagram](#) - this hyperlink will show a picture of the IR diagram.

[QUARY - code](#)

[QUARY – Select statements](#)

C#

There were no problems when making the windows form application, I used 3 forms one for the login page and one for the [grid view](#) and one for the chart.

Step by step explanation of the Windows app

[Step1-](#) The application start with the form1 which is the log in page. Log in username and password is simple

(Username: **Admin** and Password: **Passw0rd**)

Soon as the user enter the username and password the connect button will be enable to click.

And if there is an issue with connecting to the database the program will stop working and give an explanation why the program stopped working.

[Step2-](#) If the connection is successful the gridview will appear in another window and the login form will run in the background.

When the user is in the form2 the user can see the data in the database and user have access to INSERT,UPDATA and DELETE data from the database.

[INSERT](#) – user can't insert data if any of the textboxes are blank

[UPDATE-](#) when user need to update data, the user have to specify the movie ID

The search bar is a live search bar it will search data while the user is searching data and it shows all the recommended results when searching fx. If user type "Av" the search bar will automatically show Avengers.

[ASP](#) – I won't add the ASP project codes in the report but it can be viewed by opening the .sin file in the WebApp folder.

However I the screenshots of the program will be in the Hyperlinks

Step by step explanation of the Windows app

[WebHomePage](#) – In the home page the user can read about what LAX is and Contact information. And there is a link in the navigation bar and a button to access to the gridview

[WebGridView](#) – this is a different page I create by using HTML and CSS and the grid view is built in the HTML

[All the user information are in the database.](#)

Unity

I made a simple unity game where you have to jump over obstacles, there are point system and jump functions, you can jump using (space, left mouse click and arrow up buttons) if you hit an obstacle then the game will restart.

I made the interface using unity and made functions to the game using C# VS.

You can play the game on my website (it's built in a WebGL) [JumpyJump](#)

[Graphics](#)

[Game screenshots](#) - gameplay

Videos and pictures

the pictures and the SQL scrip are in the project folder and on the [hyperlinks](#).

C# codes will be in [hyperlinks](#) and the full application will is in the LAX_A_SWindowsForm folder.

The project can be viewed by opening the .sin file but it won't work properly when the database is offline.

[Captures](#) configuring windows server 2014

Time schedule

6-02-2019: Checked out all the source videos and read about creating a database on a server

7-02-2019: Installed the windows server and set up the database.

11-02-2019: Started programing the SQL database (insert all the data)

12-02-2019: There were problems with my SQL server so it took me long time to get it up and running in a way I can use it on my other computer.

19-02-2019: The final configuration on the SQL database.

20-02-2019: Programing and designing the windows form application. (Finished it the same day I started)

21-02-2019: Doing the final touches on the Server and the application and making the report.

Conclusion

This project is about learning to build a database and then on a server and create a windows form application so print data using the database.

So when the data has to be updated, developers only have to make changes on the database not in the application.

Same with making users and deleting users. The database developing team can always add and remove users from the database.

The applications will not respond to the user if the user data is not exist in the database.

So the main goal in this project is creating and learning about back end development.

Hyperlinks

SQL – LAX A/C
use master;

```
if db_id('LAX_AC') is not null
begin
drop database LAX_AC
end
```

```
go
create database LAX_AC;
```

```
go
use LAX_AC
```

```
-- create table1
```

```
create table Movie(  
MovieID int identity not null primary key,  
Title nvarchar (20),  
Movie_Description nvarchar (500),  
Casts nvarchar (200),  
ReleasedYear int  
);
```

```
-- create table2
```

```
create table Popularity(  
MovieID int identity foreign key references Movie(MovieID),  
Clicks int  
);
```

```
create table users(  
UserID nvarchar (10),  
Pass nvarchar(20)  
);
```

```
insert into users  
values('Admin','Passw0rd')
```

```
insert into Movie  
values('Avengers','Bunch of superheros tryin to kill eachother','Brian Nanayakkara, Jhonny deep,  
Mhichel Jackson',2020),  
('KILL hero','Bunch of superheros tryin to kill eachother','Happy Birthday, Gini Pig, Fluffy Wof',2010),
```

('Flex','WeirdFex but ok','Iphone X, Its Him, Not Me',2019)

insert into Popularity(Clicks) values(2123),(2223),(2323)

Select statements

```
select Movie.MovieID, Movie.Title, Movie.Movie_Description, Movie.Casts, Movie.ReleasedYear,  
Popularity.Clicks from Movie join Popularity on Movie.MovieID = Popularity.MovieID
```

```
select Movie.MovieID, Movie.Title,Movie.Movie_Description, Movie.Casts, Movie.ReleasedYear,  
Popularity.Clicks from Movie join Popularity on Popularity.MovieID = Movie.MovieID where Movie.Title  
like '%av%' or Movie.Casts like '%av%' or Movie.ReleasedYear like '%2013%'
```

```
select Popularity.Clicks from Popularity where Popularity.MovieID = 2
```

```
select Movie.MovieID from Movie
```

```
select * from Movie
```

```
select * from Popularity
```

```
select * from users
```
